

LumenX Ad Exchange — Take-Rate Analysis

VistaPort Media Inc. — Commercial and Advertising

Document ID	DR-037
Prepared by / owner	Thomas Vale
Date	20 December 2025
Classification	Strictly Confidential — Project Atlas
Period	H2 FY2025
Take-rate	~14.8% (stable)

Analysis of LumenX Ad Exchange marketplace economics for the second half of FY2025, prepared for the diligence file. Covers take-rate stability, fill rate, and the eCPM yield index across the weeks of 1 September to 29 December 2025.

1. Take-rate is stable

The exchange take-rate (net revenue retained on intermediated media) was **stable** through H2 FY2025 at approximately 14.8%, within the 14.5%–15.0% band held for the prior eight quarters. Take-rate is structurally insulated from short-term demand shifts because it is levied as a percentage of cleared media.

Average take-rate (H2 FY2025)	14.8%
Prior 8-quarter band	14.5%–15.0%
Take-rate trend	Flat — no structural change

2. Fill rate and eCPM yield — a Q4 dip

While take-rate held, the marketplace saw a measurable dip in **fill rate** and the **eCPM yield index** in the fourth quarter. The yield index (indexed to 1.000 at the start of the period) softened to an average of 0.953 across the dip weeks from a baseline of 1.003, recovering partially to 0.973 into late December. Cleared ad impressions eased from an average of 41.1bn to 38.3bn per week over the same weeks.

Week beginning	Impressions (bn)	eCPM yield index	vs baseline
1 September 2025	41.0	1.000	+0.0%
15 September 2025	41.3	1.010	+1.0%
29 September 2025	41.6	1.010	+1.0%
13 October 2025	41.0	1.000	+0.0%
27 October 2025	39.1	0.965	-3.5%
10 November 2025	36.9	0.930	-7.0%
24 November 2025	38.6	0.955	-4.5%
8 December 2025	39.9	0.975	-2.5%
22 December 2025	39.7	0.975	-2.5%

2.1 Drivers

Management attributes the dip principally to **seasonality** (Q4 demand mix and auction dynamics) and to **audience-addressability changes**. The addressable logged-in pool refreshed over the quarter — in part reflecting the staged credential-hygiene (Trust Reset) session refresh — which temporarily reduced the proportion of impressions carrying a durable logged-in identity signal and therefore softened realised eCPM on addressable inventory. Non-addressable and contextual yield was comparatively stable. Yield is expected to normalise as the addressable pool rebuilds.

3. Invalid-traffic (IVT) monitoring

Separately, and unrelated to the yield trend above, LumenX maintains continuous invalid-traffic and ad-fraud (IVT) monitoring through a third-party MRC-accredited vendor. Measured IVT remained low and within normal bounds in Q4 (general IVT 0.6%, sophisticated IVT 0.2%), with no material change quarter-on-quarter. IVT is not a contributor to the Q4 yield softness and is reported here for completeness.

4. Conclusion

- Take-rate is stable and structurally durable.
- Q4 fill-rate and eCPM-yield softness reflects seasonality and audience-addressability changes; addressability is expected to recover.
- IVT remains low and is not a driver of the trend.
- No change to marketplace fee structure or supply-path economics.

Yield index and impression figures reconcile to the weekly metric series used across the product and finance materials. Unaudited; indicative.
