|---------------------|------------------------------------------------|
| Document ID         | DR-051                                         |
| Prepared by / owner | Grace Okafor                                   |
| Date                | 8 December 2025                                |
| Classification      | Strictly Confidential — Project Atlas          |
| Function            | Privacy Engineering                            |
| Scope               | AtlasID identity graph — production data flows |

This data map documents the identity attributes that flow into the **AtlasID** identity graph, their sources, sensitivity and downstream consumers. It is maintained by Privacy Engineering and used for records-of-processing and data-protection impact assessments. It is descriptive of current production data flows.

## 1. Source systems

- **AtlasID** — current identity graph and cross-property account linkage and match service.
- **legacy\_uap** — legacy Unified Account Profile store holding pre-2022 identity/profile data; scheduled for decommission. Selected attributes from legacy\_uap have historically been migrated into, and continue to feed, AtlasID linkage.
- **VPAuth / SSOBridge** — authentication and single sign-on, providing the authenticated-user key used to resolve identities.

## 2. legacy\_uap attribute inventory

The legacy\_uap store contains the following account-profile attributes. Several are directly linked into AtlasID for matching and addressability (see consumer column).

| Attribute                | Sensitivity            | Feeds AtlasID matching? | Downstream consumer                  |
|--------------------------|------------------------|-------------------------|--------------------------------------|
| Names                    | Personal data          | Yes                     | AtlasID linkage; ad addressability   |
| Usernames                | Personal data          | Yes                     | AtlasID linkage; SSOBridge           |
| Email addresses          | Personal data          | Yes                     | AtlasID match key; ad addressability |
| Recovery email addresses | Personal data          | Yes                     | AtlasID match key (secondary)        |
| Phone numbers            | Personal data          | Yes                     | AtlasID match key; ad addressability |
| Dates of birth           | Personal data          | Partial                 | Age-gating; segment eligibility      |
| Salted password hashes   | Credential (hashed)    | No                      | Authentication only (VPAuth)         |
| Security-question data   | Credential / sensitive | No                      | Account recovery only                |

*Password hashes and security-question data are credential material used for authentication and recovery only; they are not used for matching or addressability.*

## 3. Why legacy\_uap matters to current value

Although legacy\_uap is a legacy store earmarked for decommission, a meaningful share of AtlasID match keys (email, recovery email and phone) trace their lineage to legacy\_uap records. These keys underpin logged-in addressability and personalisation. The integrity and confidentiality of legacy\_uap data therefore remains relevant to the current identity graph and to ad addressability until the migration and decommission are complete.

## 4. Downstream consumers of AtlasID

- LumenX Ad Exchange — addressable audience resolution and segment eligibility.
- Personalisation models — logged-in identity match and content/ad ranking.
- VistaMail and content properties — cross-property single-view and preferences.

## 5. Governance

Attribute-level retention, consent and minimisation are governed by the Data Retention & Deletion Policy (DR-052) and the Consent Management framework (DR-053). Migration of remaining linked attributes out of legacy\_uap is tracked under the decommission plan (DR-057).
