

User Notification System — Runbook

VistaPort Media Inc. — Product Data and Technology

Document ID	DR-058
Prepared by / owner	Maya Hart
Date	2 November 2025
Classification	Strictly Confidential — Project Atlas
System	User Notification System (UNS)
Doc type	Operational runbook

Operational runbook for the User Notification System (UNS), which sends large-scale user communications across email, in-app and push channels. This runbook covers message templates, approval, throughput limits and capacity planning. It is maintained by Product Operations.

1. Channels and capacity

Channel	Sustained throughput	Peak (with surge approval)	Audience addressable
Transactional email	6m / hour	14m / hour	Tens of millions
In-app notice	20m / hour	40m / hour	Hundreds of millions
Push notification	8m / hour	18m / hour	Mobile MAU
SMS (recovery only)	0.5m / hour	1.2m / hour	Verified phone numbers

Capacity planning assumes campaigns can address tens of millions of recipients per wave and that a full-population credential or security notice may be staged across multiple waves over several days.

2. Message templates

Template	Purpose	Approvals required
Welcome / onboarding	New-account activation	Product
Service announcement	Feature / policy update	Product + Comms
Security / credential notice	Prompt users to reset credentials or re-authenticate	Product + Security + Legal
Account recovery	Password reset and recovery flows	Product + Security
Marketing / promotional	Opt-in marketing	Marketing + Privacy

2.1 Security / credential notice template

The **security / credential notice** template is used to ask users, at scale, to reset their password and sign in again. It supports staged delivery to very large populations, suppression of already-actioned users, and reminder waves. Because of its sensitivity, it requires Security and Legal approval of wording in addition to Product sign-off. It is the template configured for the Trust Reset programme (see DR-059).

3. Approval workflow

- 1 Requestor drafts the campaign from an approved template and defines the audience.
- 2 Required approvers (per the template) sign off wording and audience scope.
- 3 Operations schedules waves within throughput limits and configures suppression lists.
- 4 Delivery is monitored; bounce/complaint thresholds trigger automatic throttling.

4. Capacity planning example (full-population staged notice)

- Stage a notice to a hundreds-of-millions population across in-app first, then email.
- Plan 4–7 daily waves with reminder waves for non-actioners.
- Reserve recovery-channel (SMS) capacity for users without an accessible email.
- Pre-warm sending infrastructure and coordinate with deliverability partners.

5. Guardrails

- Mandatory suppression of users who have already actioned the request.
- Hard caps on send rate to protect deliverability reputation.
- Legal sign-off required before any security/credential notice is released.
