

Personalisation Model — Performance Review

VistaPort Media Inc. — Product Data and Technology

Document ID	DR-055
Prepared by / owner	Maya Hart
Date	22 December 2025
Classification	Strictly Confidential — Project Atlas
Function	Product / ML
Period	Q4 2025 review

Quarterly performance review of the logged-in personalisation and identity-match models. The review covers model quality metrics, observed degradation and remediation. Figures are derived from production logs in the Snowcap warehouse.

1. Headline

- A measurable degradation in the **logged-in identity match rate** and in personalised click-through rate (CTR) emerged from **October 2025**, deepening in November before a partial recovery in December.
- The degradation is attributed to **addressability headwinds** — a reduced logged-in addressable pool — rather than to model regression. Offline model quality metrics were stable over the period.

2. Metric trend

Month	Logged-in identity match rate	Personalised CTR	Match-rate change vs Aug
Aug 2025	71.4%	0.840%	+0.0%
Sep 2025	71.4%	0.839%	+0.0%
Oct 2025	69.8%	0.827%	-2.2%
Nov 2025	67.0%	0.799%	-6.2%
Dec 2025	68.3%	0.813%	-4.3%

Index basis: August 2025 = 1.000. Match rate and CTR move with the logged-in addressable pool, not with offline model AUC, which was flat ($\pm 0.3\%$).

3. Root-cause assessment

The models themselves did not regress. The decline tracks a contraction in the **logged-in addressable pool** from late October, coincident with elevated re-authentication and the Trust Reset credential-hygiene activity, which reduced the volume of resolvable logged-in sessions available to the identity-match layer. Fewer resolvable sessions mean fewer high-confidence matches, which mechanically lowers personalised CTR even when ranking quality is unchanged.

4. Correlation with engagement

The match-rate trough aligns with the Q4 low in logged-in engagement (see the user metrics dashboard, DR-048, and VistaMail KPIs, DR-050). The personalisation yield index bottomed in the week commencing 10 November 2025 and has been recovering since.

5. Remediation

- Rebuild affected logged-in lookalike segments as the addressable pool recovers.
- Re-onboarding and re-consent flows to restore resolvable sessions.

- Personalisation model refresh scheduled in the 2026 roadmap (DR-047).

6. Outlook

Match rate and CTR are expected to return toward pre-Q4 levels as logged-in engagement normalises and re-onboarding completes. Recovery has been slower than modelled and remains a watch item for FY2026 monetisation.
