

AURORA — Executive Summary (Final)

AURORA — Executive Summary (Final)

Document ID	DR-070
Prepared by / owner	Renata Castellano
Date	20 November 2025
Classification	Strictly Confidential — Project Atlas
Classification	Confidential — Final
Prepared by	IronLake Forensics

FINAL. Executive summary of the AURORA review. This summary has been prepared for senior management and reflects the position as finalised following completion of Phase 1 procedures. It is written to be shared on a need-to-know basis and should be read together with the underlying privileged work product.

Workstream	AURORA
Prepared by	Renata Castellano, Engagement Lead, IronLake Forensics
Status	FINAL — executive summary
Date	20 November 2025

1. Background

Following the detection of anomalous activity against a historical legacy dataset in the Company's cloud object storage, an external review (the AURORA workstream) was commissioned to assess the nature and scope of the activity and to advise on remediation. This summary sets out the principal conclusions.

2. Key conclusions

- **No cleartext passwords** were present in the dataset; stored authentication material was in hashed form.
- **No payment-card or bank-account data** were contained in the dataset.
- **No confirmed ongoing attacker persistence** was identified within the current production environment at the time of review.
- The **scope of any data acquisition has not been definitively established**; the available evidence does not permit a conclusive determination of what, if anything, was removed.

3. Affected dataset

The activity concerned a historical legacy dataset retained from an earlier account-profile platform. The dataset comprises historical profile records, a portion of which relate to accounts active in more recent periods. Authentication material in the dataset was stored in hashed form. The dataset does not contain payment-card or bank-account information.

4. Authentication considerations

The review noted that legacy authentication signing material would benefit from rotation and retirement, consistent with the modernisation roadmap. Remediation in this area is recommended as a matter of good hygiene. No conclusive evidence of exploitation of the production authentication path was established.

5. Recommendations

- 1 Complete rotation and retirement of legacy authentication signing material.

- 2 Complete disposition (purge or re-encryption) of the historical legacy dataset and associated backups in line with policy.
- 3 Continue enhanced monitoring of the relevant storage and authentication paths.
- 4 Maintain the credential-hygiene programme already underway across affected accounts.

6. Status and caveats

This is a final executive summary of Phase 1. It necessarily generalises the underlying technical detail and should not be read as excluding matters addressed in the privileged work product. Certain assessments remain qualified by the available evidence as described above.

AURORA — final executive summary. Prepared for senior management. To be read with the underlying privileged materials; distribution restricted.
