

Information Security Programme — Overview

Information Security Programme — Overview

Document ID	DR-062
Prepared by / owner	Owen Bell
Date	30 September 2025
Classification	Strictly Confidential — Project Atlas
Programme owner	Owen Bell, Chief Information Security Officer (resigned Dec 2025)

This overview summarises the information-security programme of **VistaPort Media Inc.** (the “Company”) as at 30 September 2025. It is prepared for diligence purposes and presents the programme’s governance, control framework, certifications and operating model. The programme is well established and continues to mature in line with the Company’s technology modernisation roadmap.

1. Governance and accountability

The programme is led by the Office of the Chief Information Security Officer (Owen Bell, Chief Information Security Officer (resigned Dec 2025)), with Security Engineering led by Nina Petrov, Head of Security Engineering. The CISO reports to the General Counsel (Priya Raman, General Counsel) and provides a quarterly assurance report to the Audit & Risk Committee of the Board. A cross-functional Security Steering Committee meets monthly with Product, Privacy, Legal and Infrastructure representation.

Security headcount	118 FTE (engineering, operations, GRC, identity)
Operating model	24x7 Security Operations Centre; follow-the-sun on-call
Primary cloud	Primary cloud infrastructure & object storage provider
Frameworks	ISO/IEC 27001:2022, SOC 2 Type II, NIST CSF, CIS Benchmarks

2. Control framework

The Company operates a layered control framework aligned to ISO/IEC 27001 and the NIST Cybersecurity Framework. Controls are assured through internal testing, an annual external penetration test and an independent SOC 2 Type II examination (summaries provided separately in this folder).

Domain	Representative controls	Maturity
Identity & access	SSO, MFA, privileged-access management, quarterly access review	Managed
Vulnerability management	Continuous scanning, risk-based SLAs, monthly register review	Managed
Detection & response	SIEM, 24x7 SOC, documented IR runbooks, tabletop exercises	Managed
Data protection	Encryption in transit/at rest, key management, DLP	Defined
Resilience	Backup, multi-region failover, annual BC/DR testing	Managed

3. Certifications and assurance

- ISO/IEC 27001:2022 certification maintained across in-scope production services.
- SOC 2 Type II examination completed annually by an independent firm.
- Annual external penetration testing of internet-facing services and core auth.
- Continuous control monitoring with quarterly reporting to Audit & Risk.

4. Technology modernisation

A multi-year modernisation programme is progressively retiring legacy components. Known modernisation areas include consolidation of authentication onto the current **VPAuth** and **AtlasID** platforms and the orderly decommission of the legacy account-profile store. These items are tracked in the engineering roadmap and are not considered to present elevated current risk. The Company regards its overall security posture as strong and improving.

5. Roadmap priorities (FY2026)

- Continued migration of remaining services to the modern identity stack.
- Expansion of automated detection content and SOC tooling.
- Hardening and lifecycle management of cryptographic key material.
- Completion of legacy data-store decommissioning and backup-estate rationalisation.

Prepared by the Office of the CISO for Project Atlas diligence. Forward-looking statements reflect current plans and are subject to change.
